CARE & MAINTENANCE MANUAL

Care & Cleaning:

The best long-term solution for keeping your High Sierra Showerheads® looking and functioning like-new, is to simply dry with a towel after each use. This will keep the minerals in the water from clinging to the surface and leaving “water-spots”.

If you notice that water-spots are beginning to form, you can remove them by using white vinegar. To do this, spray the vinegar on a “soft” cloth and use it to wipe down the shower head. If large amounts of minerals have built up, soak entire shower head in vinegar for 3-4 hours, and then try cleaning with soft cloth. #0000 steel wool works well to remove water spots on the chrome finish only.

After cleaning, thoroughly rinse shower head with clean water to ensure that none of the vinegar is left on the shower head.

Maintenance & Repair:

To maintain proper working conditions, maintenance may be required. Our shower heads are virtually clog-free*, but on rare occasion, large particles of debris can restrict the water passageway. If you notice that there has been a sudden reduction in the flow of water coming from the shower head, it’s possible that something could be blocking the flow.

To fix this, you need to dislodge whatever is stopping the flow. First, remove the shower head from the shower arm using a crescent-type wrench. Next, look inside the shower head and see if you can see what’s blocking the flow. If you see something, use a toothpick or paper clip to remove it. You can also try tapping the metal side of the shower head on a hard surface to see if it dislodges. Next, reattach the shower head and run water through it to see if the blockage is gone. If it appears that something is still blocking the flow, please contact Customer Service at 888-445-1941.

*Sand or finer particles will pass through
